High Gold Content Alloy, Type 3
for low-fusing high-expanding ceramics

Item no. 7329 3 001
Form of delivery Casting plates
Indication Classic ceramic inlays, onlays, crowns
middle span bridges milling, conus and telescope technique

Alloy: Au 85 Pt 9 Pd 3

The alloy is free of Ni, Co, Cr, Be, Cd.

Technical data

Vickers hardness HV 5/30 125/130/175
0.2 % proof stress MPa 270/400/18%
Elongation % 12
Modulus of elasticity MPa 92,000
Average linear CTE μm/m·K 14.3/14.5
Melting range °C 25-500 °C/25-600 °C
Preheating temp. °C 1080-1215
Casting temp. °C 850/1350
Annealing °C min -
Hardening °C min 600/15

atl = after casting, n = after firing, a = hardened

Instruction for use

Instruction for use

Heimerle + Meule GmbH  Dennigstrasse 16  75179 Pforzheim Germany  Tel. +49(0)7231 940-140  Fax +49(0)7231 940-2701  www.heimerle-meule.com
Instruction for use PLATINOR® AM 1

1. Modelling
Create an anatomically reduced wax model, considering the planned veneering. Sharp edges are to be avoided, soft level crossings are to be striven at. Due to stability reasons, care has to be taken at bridge frames to achieve solid modulation of the connections and in the case of larger spans to create palatinal and interdental strength of the connecting parts. Wall thickness of the modelled (waxed) single crowns at least 0.4 (0.3) mm, bridge pillar crowns at least 0.5 (0.4) mm.

2. Spruing System
Single crown:
Direct spruing with casting channel at least Ø 3.5 mm
From 2 single crowns on and bridges:
Running bars or rings with object spruing:

3. Position of the Wax Model in the Investment Mould
Distance from the mould wall: The units should have at least 5-10 mm distance from the mould wall.
Distance from the mould bottom: Direct spruing between wax units and mould bottom a distance of 10 – 15 mm has to be kept. Investment of running bars or rings: the middle of the running bar or ring should cover the middle of the mould.

4. Investment
Cover investment mould with investment ring spacer.
Investment mould X 1 / X 3: 1 layer
Investment mould X 6 / X 9: 1 – 2 layers
Phosph ate bonded investment material is required.
The investment material manufacturer’s instructions for use have to be complied with strictly.

5. Burnout / Preheating
Conventional burning: the first preheating step at approx. 280 °C has to be hold according to the mould size for respectively 30/40/50/60 min.; further heating steps in compliance with the investment material manufacturer’s instruction for use. After reaching the final temperature (see data sheet), the holding time is according to the mould size respectively 20/30/45 min. If handling a greater number of moulds, the preheating time has to be extended accordingly.
Speed heating: the instructions of the manufacturer of the investment material have to be complied with strictly.

6. Crucible Material
Ceramic and graphite crucibles can be used.

7. Casting Units
All common melting and casting units can be used.

8. Casting
Check data sheet for casting temperatures.
Further heating times after reaching the liquidus temperature according to the quantity of material used and unit output.
Resistance heating 60 – 120 sec.
High frequency 5 – 10 sec.
Propane / Oxygen torch 5 – 10 sec.
In the case of torch melting, pay attention to the correct setting of the torch (danger of carbon damage) and melt with the reduced zone.

9. Casting Residues
In order to preserve the alloy characteristics and the casting quality, no more than 50 % cleaned casting residues should be used.
The weight used is calculated from: wax weight x alloy density
(see Heimerle + Meule calculation sheet).

10. Cooling and Divestment
Let mould cool down to hand temperature and carefully divest. This avoids deviations in fitting, change of alloy characteristics, and hot fissures. Sandblast with high grade corundum (approx. 100 μm) or with an market pickling agent to remove the investment material.

11. Finishing and Cleaning
Finish frame with tungsten carbide burs and ceramic bonded milling tools with only little pressure; then sandblast with aluminium oxide (approx. 100 μm) at low pressure (max.2 bar). For frame parts which will not be veneered high gloss polishing is recommended. Then steamclean the frame and degrease it with a suitable pickling agent (e.g. AMISUL). During grinding sufficient protection against dust inhalation has to be taken.

12. Oxidation
Ensure sufficient support of the frame. 5 min. at 930 °C without vacuum.
If the oxide layer shows spots, grind the frame again and repeat the work steps (see point 11). For conditioning of the surface, sandblast the frame with aluminium oxide (approx. 100 μm, max. pressure 2 bar) again and pickle it with AMISUL. Thoroughly steamclean the object thereafter.

13. Firing of the Ceramic
Conventional ceramics, max. firing temperature 950 °C particularly ceramics with reduced firing temperatures are suitable for veneering. Veneering should be performed in compliance with the manufacturer’s recommendations. Ideally suited for veneering is INSPIRATION or other marketable normal expanding ceramics.
During firing, a sufficient support of the frame has to be ensured; with larger span bridges an individual firing support made of phosphate bonded soldering investment material (e.g. DUROCONT L) is to be used

14. Firing Process
In regard to the firing process the indications of the respective ceramic manufacturer have to be complied with strictly.

15. Soldering
Soldering areas have to be sufficiently big and should already be considered during modelling.
Soldering areas have to be metallically blank.
The solder gap should be 0.05 – 0.2 mm.
Recommended soldering investment material: DUROCONT L
Recommended flux material: Universal soldering paste ARGOFUX
Solder before firing: PLATINOR® AM-L-Lot 1025 °C
Solders after firing: PLATINOR® Lot 1 810 °C
PLATINOR® Lot 2 760 °C
Slowly cool down the soldering object.

16. Hardening
After casting / firing the alloy shows a sufficiently high density for its area of indication. If required, the maximum hardening after veneering can be reached through final tempering in accordance to the data sheet.

17. Pickling and Polishing
Remove flux residues or oxides by pickling in AMISUL at about 80 °C or by sandblasting. Rubber-wheel the frame; final polishing can be accomplished with pastes, brushes, buffing wheels, and felt.

Our recommendations and instructions for use are based on our experience. They do not, however, replace professional knowledge and experience of dentists an dental technicians who hold sole responsibility for their decisions to select and process particular alloys. Our customer service is a non mandatory service not establishing any liability.
Warranty and damage claims are limited to the contracted contents of our General Terms and Condition.
